

A Big New Zealand Study Reveals High Rates of Kidney Injury After the Pfizer Jab

1,800 more cases than expected followed the shots, one for every 2,200 completed vaccinations; the finding is more evidence that the jabs may cause cardiovascular damage.

Drawing on a national database of over four million people, researchers in New Zealand [have found](#) a strong association between Pfizer's mRNA Covid shot and kidney injuries.

In the three weeks after a mRNA jab, the risk of acute kidney injury rose 60 percent, the researchers found. They reported almost 1,800 extra cases - the equivalent of over 100,000 extra cases of kidney injury in the United States.

The finding was posted as a "preprint" in The Lancet's database on Friday, Jan. 20. It is the third signal from a large government-managed database linking the Pfizer's mRNA shots to serious side effects in only the last six weeks.

(There's nothing cute about kidney injuries! 2279+2370-1446-1425=A LOT. Or 1778, to be specific.)

Adverse Event	No. Doses administered	Person years	Observed events	Expected events ^a	Incidence Rate Ratio (95% CI)	Risk Difference (95% CI) (per 100,000 persons)
Acute Kidney Injury						
First dose	4197826	90962276	2279	1446.2	1.6 (1.5– 1.6)	19.2 (17.1– 21.4)
Second dose	3926047	86025950	2370	1424.9	1.7 (1.6– 1.7)	23.1 (20.7– 25.4)

The authors did not define “acute kidney injury,” a term that can cover anything from relatively benign changes on laboratory tests to a serious loss of renal function.

Still, the finding is yet another signal of the potential cardiovascular risks of the mRNAs. The kidneys essentially function as filters for the blood, and renal injuries often result from reduced blood flow to the kidneys.

The researchers also found elevated rates of heart inflammation, blood clots, and platelet damage in the weeks after one or both of the shots. In all, they found a statistical link between the Pfizer shot for four of the 12 conditions they examined.

The finding is particularly strong because the researchers did not have to depend on voluntary reporting. Instead, they compared New Zealand’s national health records to its national database of people over five who received the vaccine. Just over 4 million New Zealanders, including 95 percent of adults and teenagers, received the shots, providing a large pool to track.

The researchers then compared the number of “adverse events” they found to historical background rates.

In addition, New Zealand had relatively low rates of Covid for most of the period during which people received the Pfizer jabs, so Covid itself cannot be blamed for the excess injuries.

Four of the five researchers on the paper work for the New Zealand government, which has avidly promoted the shots. It is probably only coincidence that they opened their discussion of the findings with the good news: “BNT162b2 vaccination was not found to be associated with the majority of the selected AESIs. [adverse events of special interest].”

Yes, the Pfizer jab was associated with only some of the possible side effects the researchers examined, not *every single one*.

Look on the bright side, people.

The Worldwide Corona Crisis, Global Coup d'Etat Against Humanity

by Michel Chossudovsky

Michel Chossudovsky reviews in detail how this insidious project “destroys people’s lives”. He provides a comprehensive analysis of everything you need to know about the “pandemic” — from the medical dimensions to the economic and social repercussions, political underpinnings, and mental and psychological impacts.

“My objective as an author is to inform people worldwide and refute the official narrative which has been used as a justification to destabilize the economic and social fabric of entire countries, followed by the imposition of the “deadly” COVID-19 “vaccine”. This crisis affects humanity in its entirety: almost 8 billion people. We stand in solidarity with our fellow human beings and our children worldwide. Truth is a powerful instrument.”
