There is a tectonic shift underway in the medico-scientific establishment: they are starting to walk back boosters.

The first indication of this dramatic change of attitude came from the United Kingdom last week.

On January 7, Reuters ran a wire titled [UK Says 4th COVID Jabs Not Needed for Now As Booster Effect Lasts](#). That piece featured the following sentence in its opening paragraph: **“there is no need for now for people to have a fourth shot, British health officials said on Friday.”**

Three days later, the UK Mirror published a piece titled [What Is ‘Living With Covid’? Boris Johnson Drawing Up Plans ‘To Be Rolled Out In March](#). The article quoted **Dr. Clive Dix**, the former head of the UK’s vaccine task force, who said:

“It is pointless keeping giving more and more vaccines to people who are not going to get very ill. We should just let them get ill and deal with that.”

A mere day later, Bloomberg put out an article titled [Repeat Booster Shots Spur European Warning on Immune-System Risks](#). The piece opened as follows:

European Union regulators warned that frequent Covid-19 booster shots could adversely affect the immune system and may not be feasible. Repeat booster doses every four months could eventually weaken the immune system and tire out people, according to the European Medicines Agency.

The piece goes on to quote **Marco Cavaleri**, the Head of Biological Health Threats and Vaccines Strategy at the European Medicines Agency (EMA), who said that boosters “can be done once, or maybe twice, but it’s not something that we can think should be repeated constantly.”

Cavaleri then went on to say something we had not yet heard from a high-level public health official:

“We need to think about how we can transition from the current pandemic setting to a more endemic setting.”

Around the same time, the World Health Organization (WHO) put out a [statement](#) which included this astounding sentence:

“[A] vaccination strategy based on repeated booster doses of the original vaccine composition is unlikely to be appropriate or sustainable.”

This was a truly startling development since until a week before medical authorities world over were speaking about the need for the fourth (and even subsequent) shots. In fact, some countries like Britain and Israel have already started their administration.

This sudden change of course indicates that there is something in the data that has the powers that be seriously worried. When it came to the Covid vaccines, the medical authorities have displayed an astonishing level of tolerance for side effects and collateral damage. So much so that they were even willing to let some children die unnecessarily for the sake of their vaccine agenda.

Their abrupt reversal indicates that they must have recognized that there is something very dangerous in dealing out successive doses of the vaccines. Publicly admitting that “frequent Covid-19 booster shots *could* adversely affect the immune system,” very likely means that the injections have already damaged many people’s health.

That Covid jabs may undermine the immune system has been glaringly indicated by the rise of Omicron. It has been observed that the vaccines have “negative efficacy” vis-à-vis this strain, which means that the vaccinated and boosted are getting infected at higher rates than the unvaccinated. In Ontario, for example, the vaccinated get Omicron at three times the rate of their unvaccinated counterparts.

Why would this be? The obvious explanation is that the vaccines weaken their recipients’ immune defenses and hence they are more prone to getting infected with the SARS-CoV-2 virus.

The vaccinators were defending this debacle by claiming that even though the vaccinated are succumbing to infection, they are not dying at high rates. But this is not due to the vaccines but to the fact that Omicron appears to be less virulent than its predecessors because the death rate among the unvaccinated is also low. Omicron has been so mild that in South Africa, where this variant seems to have originated and where it quickly infected a large portion of the population – most of which is unvaccinated – the Covid mortality dropped.

But it is not only SARS-CoV-2 that the vaccinated are vulnerable to. They seem to be prone to all kinds of viruses and infections. **There have been many reports of the vaccinated being unable to shake off colds and flu.**

Last week it was [reported](#) that EU Parliament president **David Sassoli** died due to serious immune system dysfunction. Sassoli was an ardent advocate of Covid passports, and it is

almost certain that he was vaccinated and boosted. One cannot but think that this may have something to do with his demise – although if it does, the authorities will never admit this.

A weakened immune system, however, is not the only adverse side effect of these inadequately tested experimental injections. Blood clots, cardiac arrest, neurological problems are among some of the other serious reported side effects of the Covid shots.

As the evidence has been accumulating about just how harmful and dangerous the Covid injections may be, the authorities tried their best to sweep it under the rug and pretend that everything was fine. But now the critical mass has been apparently reached and the establishment has realized that successive boosters are simply too dangerous to tolerate. Hence their change of mind.

This means that the dark era of forced boosting is coming to a close. It may take some time for the booster machine to stop grinding but its days are numbered.

The booster has been busted.

It was about time.
