At the outset of the pandemic, the CDC had been instructed to change the methodology regarding Death Certificates with a view to artificially inflating the numbers of “Covid deaths”. This is confirmed by the [H. Ealy, M. McEvoy study](#) quoted below.

The latest CDC report does not acknowledge a 94% “error” in the data pertaining to “Covid deaths”, It nonetheless confirms that [94% of the deaths attributed to Covid have “comorbidities”](#), (i.e. deaths due to other causes).

For 6% of the deaths, COVID-19 was the only cause mentioned. For deaths with conditions or causes in addition to COVID-19, on average, there were 2.6 additional conditions or causes per death. The number of deaths with each condition or cause is shown for all deaths and by age groups.

When the Covid data is reported, the other causes of death are simply not mentioned. It should be understood that the RT-PCR test used to “identify” Covid (PCR positive cases) is totally meaningless. A positive PCR does not confirm that the patient has the Covid disease.

A careful review of the CDC report remains to be established. The situation regarding data collection and reporting regarding cause of death remains unclear.

An earlier [report](#) published by Global Research confirmed the following:

“The 2003 guidelines for establishing death certificates had been cancelled. “Had the CDC used its industry standard, *Medical Examiners’ and Coroners’ Handbook on Death Registration and Fetal Death Reporting Revision 2003*, as it has for all other causes of death for the last 17 years, the COVID-19 fatality count would be approximately 90.2% lower than it currently is.”

For further details see: [Covid-19: Questionable Policies, Manipulated Rules of Data Collection and Reporting. Is It Safe for Students to Return to School?](#) By [H. Ealy](#), [M. McEvoy](#), and [et al.](#), August 09, 2020

The unspoken objective of this methodological change was to inflate the Covid death statistics and sustain the fear campaign.

CDC Now Says 94% of COVID Deaths Had an Underlying Condition

by Jack Davis

WesternJournal.com

August 30, 2020

A new report from the federal Centers for Disease Control and Prevention shows that in 94 percent of the cases of those who died from COVID-19, another disease was also at work on the victim.

“For 6% of the deaths, COVID-19 was the only cause mentioned,” the CDC stated in [its report](#), under the heading “Comorbidities.”

“For deaths with conditions or causes in addition to COVID-19, on average, there were 2.6 additional conditions or causes per death,” the report continued.

The [report](#) showed that in 18,116 of 42,587 deaths in the 75-84 age group, the individual who died also had the flu or pneumonia, while in 15,100 cases the underlying condition was respiratory failure.

Overall, of the 161, 392 deaths covered by the report, 42 percent (68,004) of those who died also had the flu or pneumonia while 34 percent (54,803) had an underlying condition of respiratory failure.

[This is not surprising: The RT-PCR test used in relation to Covid-19 is identical to that used in relation to seasonal influenza, M.C.]

Underlying conditions like diabetes mean greater risk for getting or transmitting COVID-19 within the home, finds a CDC study. Learn more: <https://t.co/pN20Dpfd22> pic.twitter.com/3N1Ju9vO3K

— CDC (@CDCgov) [August 18, 2020](#)

Diabetes was an underlying condition in 16 percent of the deaths (25,936 people) while various heart-related conditions including cardiac arrest, ischemic heart disease (also known as hardening of the arteries), cardiac arrhythmia and heart disease (58,687 people) were found in 36 percent of those who died.

In June, [the CDC](#) listed as high-risk individuals for [COVID-19](#) those who had chronic kidney disease; COPD (chronic obstructive pulmonary disease); obesity (BMI of 30 or higher); immunocompromised state (weakened immune system) from solid organ transplant; serious

heart conditions, such as heart failure, coronary artery disease, or cardiomyopathies; sickle cell disease; Type 2 diabetes.

Although the CDC's initial guidance suggested those over 65 were at high risk, the CDC later revised that to note that risk increases with age and that there is no single age at which risk suddenly rises.

In comments [released](#) at the time, CDC Director Dr. Robert Redfield said risk "is a continuum."

If you have certain underlying medical conditions, you are at increased risk of severe illness from [#COVID19](#), no matter your age. Find tips to protect yourself: <https://t.co/0go5iZGIQf> [pic.twitter.com/hPJRXYbY](https://t.co/hPJRXYbY)

— CDC (@CDCgov) [June 29, 2020](#)

"Based on what we've learned, we now understand that as you get older, your risk for severe disease, hospitalization, and death increases. We also updated the list of underlying health conditions that can put you at higher risk for severe disease, hospitalization, and death, based on the latest review of scientific evidence to date," he said.

"A key point is that we want to make sure that people know that as your numbers of underlying medical conditions increase, your risk of severe illness from COVID also increases," he said.

As of Sunday afternoon, the [coronavirus](#) had infected almost 6 million Americans, according to the [Johns Hopkins Coronavirus Resource Center](#), and roughly 25 million worldwide.

As of Sunday, 843,826 people had been reported as killed by the virus, with 182,909 of those being Americans.

Spread of the disease resulted in mass lockdowns across the country.

Risk is one of the factors that will go into distributing COVID-19 vaccines once those that are now in trials are ready for the market, according to [CNBC](#).

"At first, there will likely be a limited supply of one or more of the Covid-19 vaccines, because limited doses will be available," Redfield said Friday, CNBC reported. "It's important that the early vaccines are distributed in a fair, ethical and transparent way."

The list of those to be vaccinated will include health care workers, those considered essential workers at the time a vaccine is ready for distribution, and those considered at high risk due to age and underlying health conditions, according to the CDC.
