

Contagious Lies: CDC Claims Hospitalization Rising Among Unvaccinated Teens – Contrary to Its Own Data

We all knew this was coming. In order to justify the forced vaccination of children, the powers that be would somehow have to overturn 15 months of observations that COVID is less a threat to children than the flu and that unvaccinated children are [less at risk](#) than vaccinated adults (100 times less at risk than seniors), even if we are to believe Pfizer’s efficacy data.

“CDC director reports spike in teen hospitalizations, urges parents to vaccinate kids over 12,” was the [headline](#) at the Hill on Friday, reporting on the CDC’s new study of hospitalizations. Naturally, it caught my attention because we all know that hospitalizations among all age groups have been plummeting to record lows across the country in recent weeks. It turns out that along with its Morbidity and Mortality Weekly Report (*MMWR*), the CDC [published](#) a “study” purporting to show an increase in hospitalizations among 12- to 17-year-olds, with one-third of them being in the ICU and 5% of them being placed on ventilators.

A new [@CDCMMWR](#) finds of 204 adolescents hospitalized for COVID-19 during Jan-Mar 2021, nearly a third were admitted to an ICU. The report shows the importance of [#COVID19](#) vaccination for adolescents and mask use for those not yet vaccinated. More: <https://t.co/U2m55Yi02s>.

— CDC (@CDCgov) [June 4, 2021](#)

CDC Director Rochelle Walensky was ready to pounce. “I am deeply concerned by the numbers of hospitalized adolescents and saddened to see the number of adolescents who required treatment in intensive care units or mechanical ventilation,” said Walensky in a statement.

Of course, the solution is the great experimental gene therapy. “Until they are fully

vaccinated, adolescents should continue to wear masks and take precautions when around other [sic] who are not vaccinated to protect themselves, and their family, friends, and community,” Walensky stated.

CNN dutifully echoed the false data and the premise it engenders without investigating it.

New CDC report shows a recent increase in Covid-19 hospitalizations among people ages 12 to 17, reinforcing the importance of vaccinating kids <https://t.co/EX1uV2OFgX>

— CNN Breaking News (@cnnbrk) [June 4, 2021](#)

But there’s one problem. The CDC’s own data show that hospitalizations among *all* groups have plummeted over the past six weeks. It turns out they picked arbitrary start and end points - an old trick they’ve used with mask studies - which coincides with a period of increased hospitalizations among all age groups, including those with high vaccination rates.

The study period of the CDC’s report was from March 1, 2020, to April 24, 2021. It just so happens that April 24 was roughly the peak period for ALL age groups!

Guess where the CDC stopped their study: <pic.twitter.com/3relhWzEmv>

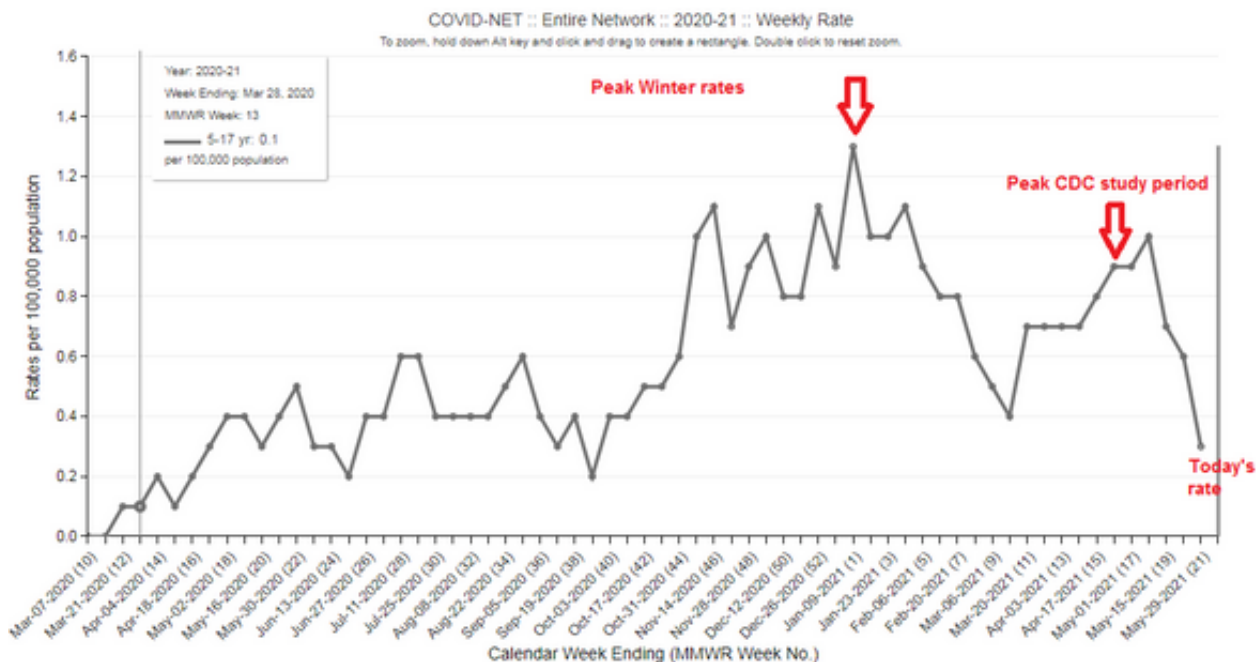

— Woke Zombie 🧟 (@AWokeZombie) [June 4, 2021](#)

Most of that mini increase (after the major winter spread) was due to the final spring spread in the northeast and upper Midwest. Based on the CDC’s headlines, one would think that childhood hospitalizations are spreading *now and* that they are rising *relative to other age groups*. In reality, they have plummeted and only rose slightly from a near-zero baseline earlier this year along with other groups.

For 2 days [@CDCgov](#) [@CDCDirector](#) have falsely claimed [#COVID19](#) kids hospitalizations are rising and are using that claim to push kids vaxx. Data below comes directly from CDC. As you can see kids hosps are in fact declining sharply. Will Sunday shows ask [@CDCDirector](#) about this? <pic.twitter.com/d8pTLYp5Xf>

— Philip Holloway 🧟 (@PhilHollowayEsq) [June 5, 2021](#)

If anything, the April 24 “peak” hospitalization rate among teens was lower than the peak during the winter, yet nobody ever felt there was an emergent situation with teen COVID hospitalizations during the worst months of the winter.

This is the same thing the CDC and others did when they [picked arbitrary start and end points](#) last year showing a decline in cases after mask mandates were instituted, while ignoring the massive subsequent increase over the winter in these same places.

But here's the kicker: Hospital rates among children actually increased more slowly during the early spring spread than among those over 65, which is the most vaccinated demographic.

4/ "Rising hospitalizations" also misses very important context - hospitalizations were rising in ALL age groups around this time frame in the Spring - even the most-vaccinated cohort (>65) - and at faster rates. Yet they use this study to justify why teen vaccinations are needed pic.twitter.com/q1ZoVpZnJe

— Eric (@The_OtherET) [June 4, 2021](#)

So, there is no way to chalk up that superficial increase with an arbitrary start and end point to lack of vaccination. It's merely a reflection of a time when cases went up mildly in a minority of the country (while plummeting in the South and West). Whatever [tiny baseline of hospitalizations](#) there are among children went up commensurately with the baseline increase during any other period of spread. Of course, today, hospitalizations are lower than ever. There is zero evidence that vaccination rates played any role in that trend.

Finally, numerous studies, [including the CDC's own data](#), show that there is a much higher rate of fake COVID hospitalizations among children than adults, aka when there is no proof they were hospitalized *because* of COVID. According to this very report from Friday, 46% of those reputed teen hospitalizations were "not clearly COVID-19 related."

5/ Something in this MMWR study that is worth mentioning, though - almost HALF (172 out of 376) of "COVID" hospitalizations in this age group were likely there for something other than COVID - further supporting the claim child COVID hospitalization numbers are inflated pic.twitter.com/kITZTQ4HOZ

— Eric (@The_OtherET) [June 4, 2021](#)

What's worse, almost half of those teens in the observational study where the cause was unclear appear to have been admitted for psychiatric reasons!

6/ Additionally in this table, of the 172 children admitted to the hospital, but not for COVID, over 44% were there for psychiatric care. This seems like a pretty alarming number, but we'd need to see what the baseline is for psychiatric admissions of adolescents. pic.twitter.com/K3IS3dNP8j

— Eric (@The_OtherET) [June 4, 2021](#)

In other words, it's likely the depression induced by the very panic the CDC is trying to exacerbate among kids that has engendered a decline in mental health leading to hospitalization, not the virus itself.

According to the U.K. Daily Mail, a [recent U.K. survey](#) of humanitarian organizations found that "more than a quarter of 75 charities surveyed said some children had expressed suicidal thoughts, while 41 per cent said some had been abused at home in lockdown." In the U.S., the CDC reports 1,139 deaths from COVID under the age of 25, but concedes that 30% of those deaths included could not plausibly be linked to the virus. At the same time, there were over 2,500 non-COVID excess deaths for that age cohort, meaning that the panic, hysteria, drug overdoses, and suicides likely killed 3.5 times as many teens and young adults as the virus.

The CDC reports 1139 deaths with Covid for those under 25, with ~30% of those not plausibly connected to Covid (cancer, suicide, etc). During this same time period, non-Covid excess deaths were >2500.

In other words, hysteria killed at least 3.5X as many children as did Covid. pic.twitter.com/e79JBCSnK1

— PLC (@Humble_Analysis) [June 6, 2021](#)

It doesn't take a forensic investigator to realize that there has been a plethora of teenagers in the hospital due to the lies overstating the threat of the virus to them. Naturally, at a time when COVID is increasing in all age groups, a certain percentage of those youngsters will test positive for the virus. Accordingly, any subsequent death of any teen who tested positive - whether he or she died from drugs or suicide - will be recorded as a COVID death.

In May, New York magazine [published](#) a story highlighting new studies showing that the pediatric hospitalization numbers for COVID have likely been dramatically inflated throughout the country. The first study, published in the official journal of the American Academy of Pediatrics, was conducted by Stanford researchers and examined 117 reputed COVID hospitalizations among those under 18 at a children's hospital in Northern California. They found that just 7.7% exhibited severe illness and 12.8% critical illness. Overall, 45% were classified as "unlikely to be caused by SARS-CoV2," and it appears that most of the others weren't suffering life-threatening illness.

The second study, [published in the same journal](#), found in America's fifth-largest hospital that, among patients younger than 22, 40% had "incidental infection," only 47% were "potentially symptomatic," and just 14% were "significantly symptomatic." They further found that "Fifty-five percent of incidental and 47% of potentially symptomatic patients had at least one identified comorbidity, while 90% of significantly symptomatic patients had at least one."

The twisted irony is that the CDC is lying about COVID hospitalization trends in order to get children to vaccinate when, in fact, vaccine-related hospitalization are really on the rise today. Dr. Monica Gandhi, an infectious disease specialist at UCSF, tallied the data from just one reported serious side effect listed in the Vaccine Adverse Events Reporting System (VAERS), myocarditis, and [found](#) that hospitalization for myocarditis post-vaccination among 12-17-year-olds is [currently 12 times greater than hospitalization for COVID](#). Why do our "public health experts" not find that *current* trend alarming?

It's quite evident that the pandemic in America is over with and it never affected children, even during its peak. However, the pandemic of lies, fear, panic, and emotional abuse is continuing indefinitely until Pfizer and Moderna satiate their rapacious appetite for children's blood. Who will defend our children?
