

Fukushima. Radiactive Cesium Contamination of Japan's Food Chain.

Almost all edibles contain radioactive cesium. Rivers and lakes are contaminated

By [Jim Bartel](#)

Global Research, August 03, 2012

Region: [Asia](#)

Theme: [Environment](#)

The Japanese people are beset by a food chain that has been thoroughly compromised by radioactive cesium.

As a result, there is no longer any public confidence in the integrity of Japan's food inspection system.

Almost all edibles tested in Japan contain radioactive cesium, and it has now been verified that shiitake mushrooms in Miyoshi City, Hiroshima Prefecture have tested above the statutory limit for radioactive cesium. Thus, radioactive cesium has now spread far beyond Fukushima Prefecture.

Like the HIV-tainted blood scandal of the 1980's, Japan's Ministry of Health, Labour and Welfare has once again been blindsided due to the lack of a proactive plan.

Radioactive cesium has been detected in the food chain numerous times.

A partial listing includes:

tap water, milk, eggs, rice, plankton, fish, *Iwana* mountain trout (*Salvelinus pluvinus*), smelt (*Hypomesus nipponensis*), seals, cabbage, spinach, parsley, green onions, cucumbers, *shiitake* and *nameko* mushrooms, broccoli, bamboo shoots, *wasabi*, plums, green tea, rice straw, hares (*Lepus brachyurus angustidens*), wild boar, bear, beef, baby formula, and mothers' milk. However, I doubt that a soil decontamination project will be attempted due to the huge expense.

The *Yomiuri Shimbun* reported on January 27, 2012 that beef contaminated with radioactive cesium (at least 300 becquerels per kilogram) from thousands of head of cattle had been sold, and most likely already consumed. According to radioactivity testing results published by the Ministry of Health, Labour and Welfare on January 31, 2012, *Iwana* mountain trout (*Salvelinus pluvinus*) from Maebashi City, Gunma Prefecture had high contamination levels for both cesium-134 (328 becquerels per kilogram) and cesium-137 (440 becquerels per kilogram). Wild boar has exceeded the government's limit (100 becquerels per kilogram for solid foods as of April 1, 2012) in numerous prefectures. There is now virtually continuous testing of edibles in many prefectures of Japan, and more than 2,300 samples (as of August 2, 2012) have tested over the statutory limits for radioactive iodine and/or cesium.

Radioactive cesium is also now being detected in food products manufactured in Japan. Therefore, there is extreme concern about short selling of food sector equities listed on Japanese stock exchanges.

Contaminated Rivers, Lakes and Bays

In Fukushima Prefecture, Lake Akimoto, Lake Hibara, Lake Onogawa, Lake Numazawa, Lake Inawashiro, Mano River, Nagase River, Ota River, Abukuma River, Niida River, Su River, Tadami River, and the Nippashi River have produced contaminated fish. As of April 17, 2012, the Hitachi-Tone River and Hanazono River in Ibaraki Prefecture have also produced contaminated fish.

Lake Chuzenji and the Kinu River, Naka River, Kuro River, Oashi River, and Yosasa River in Tochigi Prefecture have also produced contaminated sockeye salmon, brown trout, masu salmon, and Japanese dace as of April 25, 2012. Lake Onuma and the Numao River in Gunma Prefecture have produced contaminated masu salmon. The Otsu River, Tone River, and Edo River (all in Chiba Prefecture), the Ubugasawa River, Surikami River, and Takamori River (all in Fukushima Prefecture), and the Mogami River (Yamagata Prefecture) are also on the Watch List.
