*In new research published in [Microbiology & Infectious Diseases](#), immunologist **J. Bart Classen** warns the mRNA technology used in the Pfizer and Moderna COVID vaccines could create “new potential mechanisms” of adverse events that may take years to come to light.*

Back in 1999, leading U.S. Food and Drug Administration (FDA) official Dr. Peter Patriarca [contended](#) that modern advances in vaccine technology were rapidly “outpacing researchers’ ability to predict potential vaccine-related adverse events.” Patriarca mused that this could lead to “a situation of unforeseen and unpredictable vaccine outcomes.”

In a new [research article](#) published in [Microbiology & Infectious Diseases](#), veteran immunologist J. Bart Classen expresses similar concerns and writes that “RNA-based [COVID vaccines](#) have the potential to cause more disease than the epidemic of COVID-19.”

For decades, Classen has published papers exploring how vaccination can give rise to chronic conditions such as [Type 1](#) and [Type 2](#) diabetes — not right away, but three or four years down the road.

In this latest paper, Classen warns that the [RNA-based vaccine technology](#) could create “new potential mechanisms” of [vaccine adverse events](#) that may take years to come to light.

[Classen’s study](#) establishes the potential for the messenger RNA (mRNA) vaccines developed by [Pfizer](#) and [Moderna](#) to activate human proteins to take on “pathologic configurations” — configurations associated with chronic degenerative neurological diseases. Although his specific interest is in [prion diseases](#) (conditions associated with misfolded versions of normal proteins), Classen also outlines a handful of other mechanisms whereby RNA-based vaccines could give rise to “multiple other potential fatal adverse events.”

Ensuring that patients [clearly understand](#) risks — including known risks as well as [potential unknown risks](#) — is an important component of the [informed consent](#) process. This is all the more true when the intervention is experimental and lacks long-term safety data, as is the case with the Pfizer and Moderna vaccines against COVID-19. The FDA authorized the two

vaccines for widespread [emergency use](#) based on just two months of [clinical trial data](#).

Unfortunately, it is not unusual for researchers' communication of risks to be [perfunctory](#). In October, researchers at New York University and Tulane [reported](#) that the information communicated to participants in the coronavirus clinical trials about a worrisome problem known as [pathogenic priming](#) was "sufficiently obscured" as to make "adequate patient comprehension" of risks "unlikely."

It would be interesting to know what those researchers would say about Classen's blunt conclusion that "Approving a vaccine, utilizing novel RNA technology without extensive testing is extremely dangerous."

Those contemplating COVID injections may be ignoring potential risks at their own peril.
