

Is This the 4th Recent Nuclear Disaster to Strike the U.S.?

Is there any nuclear site in the United States that is not currently [collapsing, leaking or otherwise posing](#) a major health or environmental risk? Certainly there are, but that number is becoming smaller and smaller.

In addition to [three other nuclear disasters unfolding across the country](#), a fourth has now arisen. This new disaster is located in Washington state in a facility known as the Hanford site.

One week after 19 workers were sent for medical evaluation as the nuclear waste tank was being transferred because of a leak, 3 more workers are now being reported as injured at the site. According to RT, the workers inhaled radioactive fumes – the same issue facing the 19 previously hospitalized workers. This brings the injured number of workers up to 22.

The Hanford site has reportedly been leaking massive amounts of radiation for more than two weeks. By no means a recent facility, the Hanford nuclear site is one of the original nuclear facilities in the United States, having been part of the Manhattan Project itself. Weapons-grade plutonium was stored at this facility for use in atomic weapons, one of which was dropped on Hiroshima.

Although the facility was decommissioned at the end of the Cold War, the facility has been used to store nuclear waste. In fact, [according to RT](#), two-thirds of America's radioactive materials are stored at this location which makes it one of the largest facilities of its kind in the world.

The storage tanks which were built as early as 1940 and as late as 1970 contain 56 million gallons of radioactive chemicals.

According Gerry Pollet, a Washington State Representative, those tanks were never expected to last longer than 20 years.

Pollet says,

Twenty years was a dream in the first place. And, as you know, some of them didn't last 20 years – and we had a small explosion on the 1950s. That hot waste boiled; created a steam explosion under the tank, and we were lucky that we didn't have half of eastern Washington having to be permanently evacuated.

The company operating the facility acknowledged “higher-than-normal readings for contamination” for a certain tank, but claimed that the readings “well below the alarm level.” RT correspondent Alexey Yaroshevsky traveled to the Hanford site with a Geiger counter.

Yaroshevsky measured the radiation levels of a rock laying well outside of the containment facility and, while the readings were not considered an emergency even the reporter’s handheld device registered a higher-than-normal level of radiation.

Yaroshevsky wondered aloud whether or not the radiation levels closer to the center to the containment facility would be much higher. The reports of the Hanford site leakage now add a West Coast dimension to the nuclear crisis that has escalated in the last few weeks.

In addition to Hanford, reports [West Lake Landfill](#) in St. Louis, Missouri which houses sizable amounts of nuclear waste is facing [an approaching fire from](#) an adjacent landfill that threatens to turn West Lake into a cauldron of radioactive air pollution. In addition, a nuclear power plant in Turkey Point, Florida is reportedly [leaking polluted water into Biscayne Bay](#). New York’s Indian Point power plant is also threatening to become a major radioactive incident. [Constant leaks, mishaps and other signs](#) of an outright collapse have existed at Indian Point for quite some time but have increased in frequency over the last year.
