

Measles Outbreak Documented Among Fully Immunized Group of Children

Hell hath no fury like a vaccine zealot during a disease outbreak, with this latest Disneyland measles fiasco a perfect case-in-point. While the corporate media foams violently at the mouth over a few children, *some vaccinated*, who allegedly contracted measles at Disneyland because not everyone chooses to vaccinate — one hate-filled report from a major news outlet has actually called for parents who oppose vaccinations to be jailed — the level-headed, rational segments of society will recall that many earlier measles outbreaks occurred among fully vaccinated groups of people, debunking the official myth that vaccines provide protection against disease.

In 1987, for example, a study published in the *New England Journal of Medicine* (NEJM) documented a measles outbreak that occurred in Corpus Christi, Texas, in the spring of 1985. Fourteen adolescent-age students, *all of whom had been vaccinated for measles*, contracted the disease despite having been injected with the MMR vaccine. Researchers noted that more than 99 percent of students at the school — basically all of them — had also been vaccinated, with more than 95 percent of them showing detectable antibodies to measles.

This highly revealing study completely contradicts the official narrative being propagated today that unvaccinated individuals are responsible for disease outbreaks like the one that reportedly began at Disneyland. None of the students in Texas who contracted the [measles](#) in 1985 were unvaccinated, and virtually none of their peers were unvaccinated. Consequently, so-called “herd immunity,” which would have been activated based on what health authorities claim as indisputable immunological fact, was also shown to be an unsubstantiated myth, further vindicating the unvaccinated as a possible cause of this particular outbreak.

So what *did* cause 14 fully vaccinated student to catch measles? A failure of the [MMR vaccine](#), of course, which you will never hear about from the prostitute press. There’s no other valid explanation for why a fully vaccinated group of children, who were surrounded by an almost fully vaccinated group of peers, contracted a disease for which they should have been immune, according to the official story. And there’s no blaming the one or two students who weren’t vaccinated for this [outbreak](#) because:

- 1) not a single unvaccinated student contracted the measles; and
- 2) herd immunity would have been activated regardless, supposedly protecting everyone.

CDC data published after 1985 outbreak reveals exceptional failure of MMR vaccine

Additionally, those who *were* vaccinated should have been protected by the vaccine either way — that is, if vaccines really work as claimed. They obviously don't, which is further evidenced by data later published by the U.S. Centers for Disease Control and Prevention (CDC) in its *Morbidity and Mortality Weekly Report* (MMWR).

In a 1988 issue of the report, the CDC published data on measles which documented 3,655 cases of measles in 1987, the previous year. Guess how many of these cases were in vaccinated individuals? 1,903, or roughly 52 percent — more than half! So much for the effectiveness of that MMR [vaccine](#) that health authorities want you and your family to rush out and get immediately.

MMR is the same vaccine, of course, that was exposed by the CDC whistleblower as causing autism, particularly in young African American boys. And because MMR contains attenuated (weakened) live measles virus, it can also shed from vaccinated individuals to others, which may have been behind past measles outbreaks.

There are number of possible factors here that the media is ignoring in its vicious witch hunt to demonize all those “anti-vaxxers” out there who have legitimate concerns about the safety and effectiveness of this controversial vaccine. But don't let them bully you — it is ultimately your decision to decide what's best for your children, even if it means foregoing what the establishment claims is the solution.
