Official data hidden within News Reports published by the New Zealand Ministry of Health has revealed that the fully vaccinated population account for the vast majority of Covid-19 hospitalisations in New Zealand, with some days seeing the triple/double jabbed account for 100% of people admitted to hospital.

The Expose - On the 16th Feb 22 the New Zealand [Ministry](#) of Health published a News Report containing information on Covid-19 Hospitalisations by vaccination status. In it they confirmed that of the current hospitalisations among the Northern Region, the unvaccinated population accounted for 2 hospitalisations, whilst the fully vaccinated accounted for 23 hospitalisations.

So we took a look back at previous news reports published by the New Zealand Ministry of Health to paint a picture on the current alleged Covid-19 pandemic sweeping the country.

[These are the reports we analysed, dating back to 25th Jan 22.](#)

The following chart shows the total number of Covid-19 hospitalisations by vaccination status each day in New Zealand between 25th Jan 22 and 16th Feb 22 -

As you can see, every single day has seen the fully vaccinated account for the vast majority of Covid-19 hospitalisations, and as of the 16th Feb 22 things look like they are getting progressively worse for the fully vaccinated but improving for the unvaccinated.

On the 25th Jan 22 just 6 people were hospitalised with Covid-19, with the fully vaccinated

accounting for 5 hospitalisations, and the unvaccinated accounting for 1 hospitalisation. But by the 16th Feb 22, there were 25 people hospitalised with Covid-19, with the fully vaccinated accounting for 23 hospitalisations, and the unvaccinated population accounting for just 2 hospitalisations.

The following chart shows the percentage of Covid-19 hospitalisations by vaccination status in New Zealand between 25th Jan 22 and 16th Feb 22 -

Six of the 19 days have seen the fully vaccinated account for 100% of Covid-19 hospitalisations, this is despite approximately 79% of the New Zealand population being considered fully vaccinated.

The most recent 2 days of data has seen the fully vaccinated account for 90% of hospitalisations on the 15th Feb and 92% of hospitalisations on the 16th Feb 22.

The New Zealand Ministry of Health has refused to publish the number of Covid-19 deaths by vaccination status, but we think it's plain to see by the very limited data they have quietly published on Covid-19 hospitalisations, that the country is very much in the midst of a Pandemic of the Fully Vaccinated, and it looks like Covid-19 vaccination has offered zero benefit in preventing hospitalisation.

In fact, from the numbers given it appears vaccination has made things worse.
