Instead of presenting evidence of Russian hacking, Western mainstream media outlets are continuing to peddle fiction, adding drama with every new story they publish.

CNN, which dubs itself as the “most trusted name in news,” has arguably topped the ranks of “fake news” outlets when it published yet another [story](#) on the subject of Russia hacking the US election. This time, alongside the baseless accusations, CNN decide to use an image from a popular video game Fallout 4 to help illustrate to its audience what Russian hacking actually looks like.

Shortly after the gaffe was caught by Reddit users, CNN changed the image to a stern looking Obama. This, however, did not prevent a screenshot of the previous image from going viral.

If before CNN was simply presenting fiction as fact, now it is also illustrating it using video game art. It's difficult to imagine how a news story can get any more fake than this.

BRG [reports](#):

In Fallout 4 — as well as Fallout 3 and Fallout: New Vegas — the player can hack computers to gain information or unlock doors and safes. It's performed like a word puzzle, where the player has to find a specific word in a huge mess of letters and random characters. It's simple but fun, but it has absolutely nothing in common with actual hacking, which is what makes it perfect for mainstream news viewers.
