

Plunge in Kindergarten-aged Children Vaccination Rates, US Officials Pushing for Herd Immunity

The number of parents deciding **not** to vaccinate their children is growing at an alarming rate – at least according to officials who are now nonplussed at the wakening of humanity.

Considering the quite ‘heavy’ vaccination schedules proposed by the Centers for Disease Control (CDC), American Academy of Pediatrics (AAP), and American Academy of Family Physicians (AAFP), parents *should* be refusing vaccinations. Since the 1950’s, the number of vaccines children under 6 are expected to obtain has [grown by 414%](#). Apparently, at least Californian parents have had enough and are [refusing to immunize their kindergarten-aged children](#).

Public health experts are saying that these refusals to have their children vaccinated (at a rate of half as often than just 7 years ago) is contributing to the re-emergence of measles across the state, and may lead to serious outbreaks of ‘other diseases.’ But this is nothing more than scare-mongering and the typical line of vaccination-pushers.

Actually, there are numerous [studies](#) which show that un-vaccinated children [are far healthier](#) than their vaccinated peers. Findings uncovered during one study looking at New Zealand’s children found that:

“. . . 92 percent of the children requiring a tonsillectomy operation had received the measles vaccination, indicating that the vaccination for measles may have made some of the children more susceptible to tonsillitis.”

The percentage of kindergartens in which at least 8% of students are not fully vaccinated because of personal beliefs has more than doubled as well, according to data on file with the state.

Health officials are not pleased with this trend since they believe in herd immunity, and since according to ‘experts,’ measles and whooping cough need at least 92% of kids immunized. The CDC is a big [pusher of herd immunity](#), but as a direct result of vaccinations, [mucosal immunity](#) in children is very weak. This leads to more than one million children having to have tubes put in their ears every year due to Otitis Media or “glue ear.” It is a buildup of water in the ear, which requires this invasive medical procedure.

Despite herd immunity propaganda, there is no system of the human being, from mind to muscles to immune system, which gets stronger through avoiding challenges, but only through **overcoming** challenges.

Furthermore, it is a lie that disease will spread without vaccinations at a 95% rate. In truth, most states fail to [meet the CDC's goals](#) of extending basic immunizations to 80% (not 95%) of children. Rates ran as low as 65% in Colorado in years past, and as low as 75% in Florida. This did not cause a sudden epidemic of measles, or flu, or whooping cough. Some experts suggest that [herd immunity is a myth](#) created by those who might profit from it. It looks like many Californian parents agree, or at least are wary of vaccines in general.

“Five days a week, [children are] in their small classroom,” said Shannon Stokley, an epidemiologist at the National Center for Immunization and Respiratory Diseases, part of the Centers for Disease Control and Prevention. “That’s the perfect conditions for spreading germs and spreading infections.”

What Stokley seems to disregard are the numerous other factors which can contribute to outbreaks.

Barbara Loe Fisher, president of the National Vaccine Information Centre, a consumer’s group based in Virginia, [argues that vaccines are responsible for the increasing numbers of children and adults who suffer from immune system and neurologic disorders, hyperactivity, learning disabilities, asthma, chronic fatigue syndrome, lupus, rheumatoid arthritis, multiple sclerosis, and seizure disorders](#). She believes more studies to monitor the long-term effects of mass vaccination should be conducted. She wants physicians to be absolutely sure these vaccines are safe and not harming people.

Neil Z. Miller, vaccine investigator, [points to the polio vaccine](#) as an example. It is now responsible for every new polio case in the U.S.

Holly Blumhardt and her husband, Shannon, are part of a [growing minority in Orange County](#) and other affluent areas across the county: They do not vaccinate their children. She says:

“It is part of a larger philosophy. I think that we are very aware, from the foods that we eat, like being more organic, non-GMO . . . We just want to have the healthiest family that we can.”

California immunization rates have been dropping since the 1980s, but the recent drop in the past 7 years is a convenient excuse for health officials to claim for a disease that could have been caused by super bugs, environmental conditions like drought, and any number of other mitigating factors.

The trend is [especially pronounced in Orange County](#), where the proportion of kindergartners with their full shots fell from 92.9% in 2003 to 89.3% in 2012, predominantly in the county’s wealthy beachfront communities. The county is also battling the state’s largest measles outbreak in recent memory: 22 cases.

The CDC blames anti-vaxers for the recent outbreak. Assistant surgeon general Dr. Anne Schuchat says:

“The current increase in measles cases is being driven by unvaccinated people, primarily U.S. residents, who got measles in other countries, brought the virus back to the United States and spread to others in communities where

many people are not vaccinated.”

Within the report, however, was an admittance that unvaccinated missionaries returning from the Philippines [were included in their data](#), where a measles outbreak of 20,000 reported cases resulted in 50 deaths.

“90 percent of all measles cases in the United States were in people who were not vaccinated or whose vaccination status was unknown. Among the U.S. residents who were not vaccinated, 85 percent were religious, philosophical or personal reasons.”

Even high antibody titers in people only convey a 68% chance of protecting against or delaying clinically manifest measles. In Africa, vaccination with the MMR-vaccine has reduced the diseases vaccinated against, but **has doubled mortality rates in infants** [after a single dose](#).

California state law requires kindergartners to be vaccinated against measles, pertussis (whooping cough), polio, mumps, rubella, hepatitis B, chicken pox, diphtheria and tetanus.

Parents who claim immunization is against their personal beliefs can get exemptions. Some [parents opt out of all the mandatory shots](#), while others allow students to get *select* vaccinations. There are also temporary and medical exemptions available.
