*Recent outbreaks of a sickness known as the Zika virus have sparked hysteria across the globe, and many reports have actually indicated that this is likely a man-made disaster, as the origin of Zika itself is somewhat strange.*

The virus was “discovered” in 1947, however, it was not discovered in the wild nor did it spontaneously arise. In fact, it was discovered by Rockefeller Foundation scientists in a monkey that they had in captivity, leading many to believe that this was the result of some type of experiment. Since then, cases of Zika have been extremely rare, but in the past few years, outbreaks of Zika have been on the rise, especially in South America and specifically Brazil.

Oddly, the recent outbreak in Brazil coincides with the release of genetically modified mosquitoes in 2012, by the British biotech company Oxitec. Not only did the new outbreak occur just after the release, but it also occurred in the same area.

Ironically enough, the GM mosquitoes were actually proposed as a solution to infectious disease, but many experts warned that there was not enough research and that a release of such an organism into the wild could have disastrous consequences.

As news of Zika spread this week, rumors also reached the internet that the virus was available for purchase online. Sure enough, there is actually a sale [listing for Zika online through a website called atcc.org](#), where a number of different viruses and biological agents are sold to research teams. For the sake of investigation, the Free Thought Project tried to go through the application process that was required to buy the virus, just to see if anyone with \$516 to spend would be able to get their hands on it.

The screenshot shows the ATCC website product page for Zika virus (ATCC® VR-84™). The page includes a navigation breadcrumb: Home > Products > All Products > VR-84™. The product title is 'Zika virus (ATCC® VR-84™)' with a classification of 'Flaviviridae, Flavivirus' and a product format of 'freeze-dried'. There are tabs for 'GENERAL INFORMATION', 'CHARACTERISTICS', 'CULTURE METHOD', 'SPECIFICATIONS', and 'HISTORY'. A 'DOCUMENTATION' tab is also present. The main content area lists product details: Classification (Flaviviridae, Flavivirus), Agent (Zika virus), Strain (MR 766 (Original)), Biosafety Level (2), Product Format (freeze-dried), and Storage Conditions (-70°C or colder). A note states: 'Biosafety classification is based on U.S. Public Health Service Guidelines, it is the responsibility of the customer to ensure that their facilities comply with biosafety regulations for their own country.' To the right, there is a pricing section for 'Zika virus ATCC® VR-84™ freeze-dried' with a quantity input field and an 'Add to Cart' button. The prices are: For-Profit: \$516.00 and Non-Profit: \$430.00. Below this is a 'CUSTOMER SERVICE' section with a 'Learn More' link. At the bottom left, there is a 'QUICK LINKS' sidebar with links for 'New Features', 'How to Order', 'Purchasing Agents', and 'Product Use Policy'. At the bottom right, there is a 'RELATED PRODUCTS' section for 'Zika virus (ATCC® VR-1838™)' with a quantity input field and an 'Add to Cart' button. The prices are: For-Profit: \$354.00 and Non-Profit: \$295.00.

In case there are people out there who think this may be a 'conspiracy theory,' you can plainly see that the source for the Zika virus is, in fact, from *J. Casals, Rockefeller Foundation*, and sourced from *Blood from experimental forest sentinel rhesus monkey, Uganda, 1947*.

After initially trying to buy the virus, we were prompted to create a user account on the website. After that, we were led through a dozen pages of forms, where we were asked information about our organization, tax ID # and the biosafety level of our lab. While this seems to be tight security, we were able to input false information and fudge the requirements to complete the application process. We are still waiting for our application to

be approved, but we did not have to upload any type of proof that we are a legitimate facility.

It seems that while the virus is available online, it is not extremely easy to get, and would likely require some extremely creative fraud in order to make it happen. However, it definitely does seem that it would be possible for a group or individual that is determined enough to make their way through the website's security measures.
