On Thursday evening Israeli forces stormed Aida refugee camp in the southern occupied West Bank city of Bethlehem. Jeeps descended on the camp from all entrances shooting off tear gas rounds indiscriminately, Akkram Huessni, a young man from the camp told Mondoweiss.

Families rushed to close their windows, shoving cloth in any crevice that could allow the noxious gas to seep in, a well practiced drill in homes across the occupied West Bank.

While Aida is known for being politically charged, generally Israeli forces focus on protesters, but on Thursday the forces seemed to be ignoring the protesters and going for the general community instead, firing copious amounts of tear gas, Huessni said.

“The entire camp was full of gas,” he recalled. “We had to have people with gas masks all over in order to pull people who got stuck outside out of the white clouds”

During the middle of the assault, the Israeli army and border police — in a surprise move — issued a message to residents via loudspeaker. One young man caught the entire message on video.

“People of Aida refugee camp, we are the occupation army,” the border police officer’s voice boomed through a main part of the camp in Arabic. “If you throw stones, we will hit you with gas until you all die – the youth, the children, the old people, you will all die.”

“You will all die,” the officer said.

“We won’t leave any of you alive. We have arrested one of you, he’s with us now, we took him from his home and we will slaughter and kill him while you watch if you keep throwing stones. Go home or we will gas you until you die, your families, your children, everyone. We will kill you,”

the message continued.

The border police officer who issued the message was reportedly suspended from duties,

Israeli media reported. While the message caught on video was shocking for a number of reasons, it pointed out at least one important truth, tear gas kills.

The next day the threat came to pass as an 8-month-old baby, Ramadan Thawabta, suffocated and died from tear gas inhalation during clashes in Beit Fajjar village, just south of Bethlehem, doctors told Palestinian news agency, Ma'an News.

A little more than a week previously, a 54-year-old peace activist with cardiac disease suffocated on the gas and died. Doctors confirmed that it was the tear gas, and not his previous condition that killed him, according Ma'an.

A “non-lethal” chemical weapon

Tear gas is a supposedly non-lethal chemical weapon, heavily used by Israeli forces in the occupied West Bank and other areas of the Palestinian Territory. The gas belongs to a group of chemical agents referred to as “lachrymatory agents,” from the latin word “lacrima,” meaning tear.

The name however, is misleading for two reasons. First, tear gas is not a gas at all, but rather a solid chemical made into an aerosol that hangs in the air when released. The gas settles on surfaces, including clothes, and can be reactivated if a surface the tear gas has settled on comes into contact with skin days later.

Secondly, tear gas affects much more than just the eyes, as skin and breathing passages are equally sensitive to the chemical.

A child closes his eyes tightly, waiting for the effects of tear gas to pass. The young boy knows well not to touch his face, which would worsen the symptoms. (Photo: Abed al Qaisi)

When exposed to tear gas the eyes are the first to become affected, as the gas begins to sting and makes it difficult to see. Touching the eyes or putting water on the affected area only makes it worse. The second effect is on the respiratory system, as the gas makes it feel as if the victim's chest is constricting and it becomes difficult, if not impossible to breathe.

Tear gas also stings and inflames any parts of the skin that is sensitive or damp, like the face, neck and inner arms. Heavy exposure can sometimes lead to burns or blisters, and sweat or water can activate the gas on the skin hours after exposure.

If overexposed, particularly for children, the elderly and people with respiratory problems such as asthma, the "non-lethal" gas can be deadly.

Palestinian defenses

Tear gas is forbidden to be used during warfare under the Chemical Weapons Convention, which was adopted by the Conference on Disarmament in Geneva in 1992. According to the United Nations, 98 percent of the global population has signed the agreement, including Israel.

It is unknown if the chemicals in modern-day tear gas cause long-term effects, as there have been very few studies done on the matter.

Regardless of its supposed illegality and unknown side effects, one would be hard pressed to find a household in the occupied Palestinian Territory that does not know how to combat symptoms of the gas due to its frequent and heavy use by Israeli forces on Palestinians.

On any given day in villages, cities and refugee camps across the occupied Palestinian Territories, where clashes have become a daily occurrence, Palestinians are combating the chemical weapon.

In Aida refugee camp, three teenagers lie flat on the floor of a stranger's home. While one young woman holds a fan over the young men, the mother of the household grabs an onion ready and waiting on living room table and begins holding broken pieces of the root to the faces of the suffering young men.

Locals use onions, perfume, vinegar and rubbing alcohol to combat the symptoms, though little is known as to why these methods seem to offer relief.

When one young man seems to be severely affected, a medic is summoned from the street outside. The medic, a volunteer who has spent nearly every evening since the start of October helping those injured during the daily clashes, quickly comes to the aid of the young man.

The medic begins lightly beating on the chest of the teen, asking him repeatedly to try and speak. Another medic enters the room, breaking open an alcohol swab and cleans the teen's face of the chemical. Eventually the young man comes to and can breathe again. He lies red-faced and exhausted on the ground until the effects completely wear off.

A similar scene is repeated daily throughout the occupied Palestinian Territory.

Israeli army jeeps have the capability of shooting off up to 60 tear gas canisters at once without reloading. (Photo: Abed al Qaisi)

According to Ma'an News Agency, the Red Crescent reported that 5,399 Palestinians were treated for excessive tear gas inhalation during the month of October — an average of 174 people a day.

One protester examines the leg of another after he was hit with a tear gas canister during clashes. A hit with a canister can break the skin, cause bruising and chemical burns. (Photo: Abed al Qaisi)

In addition to injuries caused by the gas, the tear gas canisters themselves sometimes hit protesters, injuring them from the force of the metal tube cutting through the air, as well as from the heat of the metal. The canisters alone can break the skin, shatter windows and catch trees and fields on fire — all things that have long-been a daily reality for Palestinians.
