Switch mental gears and stop thinking about the pandemic. Think about the endless news stories you have seen and heard on all mainstream media that headline stories with a large number of deaths. The deaths may result from large scale criminal acts like mass shootings or all kinds of natural disasters. Big media makes big news when a dozen or more people get killed, or when hundreds die in floods or hurricanes. Rarely are thousands dead, but when that happens, usually in other countries, that is really big news. And it happened for the 9/11 attack when about 3,000 people died in the US.

The point of this article is that the media now is largely ignoring the thousands dying from the experimental COVID vaccines. My exhaustive analysis of medical studies and data reveal that Americans are dying in two different ways because they got jabbed.

Two types of vaccine deaths

A few thousand people have died from breakthrough infections because the vaccines are not effective in preventing a new infection. What is now crystal clear is that the experimental vaccines lose their effectiveness over some months. The number of breakthrough infections are accelerating for two reasons. As more people get the shot a larger pool of vaccinated people drive more breakthrough infections. And now with declining vaccine effectiveness, possibly related to new variants, the odds of getting a breakthrough infection go up. While many breakthrough infections do not cause major medical problems, in a fraction of cases victims need hospitalization and some die.

The other cause of vaccine deaths are complex blood problems, namely different kinds of blood clots, the loss of blood platelets and resulting bleed events that are lethal. Think in terms of brain bleeds, strokes and heart attacks. Vaccine induced blood problems have been [discussed](#) here.

Number of vaccine deaths

My data analysis indicates that now we have probably lost close to 5,000 American lives from the two vaccine related deaths and most likely this will increase to perhaps 10,000 deaths by the end of this year.

The vaccine related deaths of many hundreds and certainly thousands of people should be a big news story. It is not. Why not? Because all of the corrupt and dishonest powers mismanaging the pandemic want to keep pushing and coercing everyone to get the shot. So, they stifle the truth about vaccine dangers.

They keep justifying this by saying that only a small statistical fraction of the vaccinated die and compare this to the over 600,000 COVID deaths that the experimental vaccines supposedly could have prevented. Here is the truth. Vaccine induced deaths cannot be prevented. They result from the deficiencies of the vaccines.

On the other hand, COVID deaths have always been highly preventable, say 85 percent or more, because since March 2020 we have known that several cheap, safe and FDA approved generics cure COVID and also can be used to prevent the infection. Plus, many of those official COVID deaths were probably for people dying from other causes; they died with COVID, not from it.

Here is what people need to keep in mind. Can you imagine anything worse than getting a shot of an experimental COVID vaccine and then sometime later dying from the infection or a blood problem? I can't. How could the government let such vaccines be widely used? Follow the money. All the way to big drug companies making vaccines.

Breakthrough infection data

It is hard to get good, reliable data on the post-vaccination breakthrough infection death rate. The likely answer is that the government wants to keep that data as hidden as possible. Why? Because the more that Americans know about breakthrough deaths, the more they will question the medical wisdom of getting either the first shot or a booster jab.

So, what does the breakthrough death data look like? That depends where you look for the data. Can you expect to see the same numbers everywhere? No. Can you expect to see such data in your daily newspaper or on you evening network news? No.

One seemingly good source is an August New York Times [compilation](#) of breakthrough deaths from 40 states and the District of Columbia. That list yields 1,527 deaths. But when extrapolated to the whole nation, that adds up to possibly 1,899 deaths. Expectedly, all the pro-vaccine people in government, public health and the medical establishment think that kind of number is just fine.

Their argument is simple. With so many millions of people vaccinated a few thousand breakthrough deaths is acceptable. Except for those who die and their family and friends. Something akin to putting a bandage on a cut after putting some antiseptic on it and then sometime later losing a limb or your life from a terrible infection. Just one of those statistical ugly and unlikely realities.

I checked out some other places for similar data. Here is what I found.

A Los Angeles Times [article](#) from May said:

“In all, 160 fully vaccinated people with a breakthrough infection died during the study period. That’s 2% of those with breakthrough infections, and 0.0001% of U.S. residents who were fully vaccinated by April 30. All 160 people were between the ages of 71 and 89.”

Just 160, sounds pretty good, especially compared to close to 2,000. And the statistics make it seem oh so unlikely that you will die from COVID after vaccination. That figure of 160 came from a CDC [report](#). And there now are breakthrough deaths in much younger people.

An [article](#) from Heritage in August cited a figure of 1,507 fatal cases of breakthrough infection in line with the New York Times data. This too was cited; “164 million Americans were fully vaccinated against COVID-19, with 191 million people having acquired partial immunity through at least one dose.” Seems like you just have to bet on being statistically safe.

An August [story](#) on CNBC reported:

“NBC News has found that at least 125,000 fully vaccinated Americans have tested positive for Covid and 1,400 of those have died. Still, the 125,682 “breakthrough” cases in 38 states found by NBC News represented less than 0.08% of the 164.2 million-plus people (and counting) who have been fully vaccinated since the start of the year, or about one in every 1,300.”

Here is the headline of [story](#) in New York Magazine from this month: “Don’t Panic, But Breakthrough Cases May Be a Bigger Problem Than You’ve Been Told – Current public-health messaging may understate the scale and risk.”

This was a wise observation:

“a closer look at the data reveals that some of the public-health communication may be overstating the vaccine effect on transmission and understating the scale and risk of breakthrough infections, which, while far from predominant, do appear prevalent enough to be helping shape the course of the disease.”

“The message that breakthrough cases are exceedingly rare and that you don’t have to worry about them if you’re vaccinated — that this is only an epidemic of the unvaccinated — that message is falling flat,” Harvard epidemiologist Michael Mina said.

Also noted was [a large pre-print study](#) published by the Mayo clinic that suggested the efficacy against infection had fallen as far to 42 percent, far below numbers in the 90s you have been hearing about since the experimental vaccines received emergency authorization. This helps explain escalating breakthrough cases.

The article also pointed these facts out: “In Utah, 8 percent of new cases were breakthroughs in early June, but by late July, as Delta grew, the share grew, too, to 20 percent (even while the total number of cases almost doubled). According to leaked CDC documents, there were, as of late last month, 35,000 symptomatic breakthrough cases being recorded each week — about 10 percent of the country’s total.

Presumably many more breakthrough cases were asymptomatic, which would drive the share up further.” But as of late May CDC started to only count breakthrough cases resulting in hospitalization or death. Their objective was to not count more minor breakthrough cases that would reveal reduced vaccine effectiveness.

“The breakthrough problem is much more concerning than what our public officials have transmitted,” Dr. Eric Topol said. “We have no good tracking. But every indicator I

have suggests that there's a lot more under the radar than is being told to the public so far, which is unfortunate." The result, he said, was a widening gap between the messaging from public-health authorities and the meaning of the data emerging in real time.

"I think the problem we have is people — whether it's the CDC or the people that are doing the briefings — their big concern is, they just want to get vaccinations up. And they don't want to punch any holes in the story about vaccines. But we can handle the truth. And that's what we should be getting."

Blood problem deaths

The US government is not providing good data on vaccine induced blood problem deaths. There are some websites that provide large numbers of videos about those who have died from brain bleeds, strokes and other conditions related to blood clots, loss of blood platelets and lethal bleeding. [Health Impact News](#) and [1000 Covid Stories](#) are terrific.

Here is some data from a recent UK research [study](#) that addressed blood clots in "veins of the legs and in lung arteries." The researchers offered rather high rates of the main blood clot/low platelet condition from the use of the AstraZeneca vaccine: 1,000 per 100 million for people 50 and over and 2,000 per 100 million for younger people. These suggest a potential for thousands of vaccine induced blood deaths in the US. Keep in mind that many people may be dying from blood problems but no test done to verify it is caused by a vaccine.

Additionally, a Canadian doctor [found](#) evidence of microscopic blood clots in 62 percent of his patients that had received the Moderna vaccine. He predicted dire long term health impacts from these clots in capillaries. He said this:

"The blood clots we hear about which the media claim are very rare are the big blood clots which are the ones that cause strokes and show up on CT scans, MRI, etc. The clots I'm talking about are microscopic and too small to find on any scan. They can thus only be detected using the D-dimer test...The most alarming part of this is that there are some parts of the body like the brain, spinal cord, heart and lungs which cannot regenerate. When those tissues are damaged by blood clots they are permanently damaged."

Future medical problems and deaths from the microscopic blood clots at this point are speculative.

Conclusions

Here is my logical bottom line. Getting a shot these days is gambling that you will not be that statistical fluke, dying from a lack of protection against COVID from any of the experimental vaccines. Keep in mind that with so many millions of people being vaccinated breakthrough infections are likely to keep rolling up.

And think of your gamble as related to the possibility that you might die from vaccine induced blood clots or bleeding, especially in the brain. And then add these two pieces of true science facts.

If you have natural immunity from being infected at some point you have better immunity than that conferred by the experimental vaccines. Getting a shot might cause serious medical problems if you have natural immunity.

And finally, never forget that since March 2020 we have absolute scientific truth that several cheap, safe and fully FDA approved generic medicines not only can cure COVID but also can be used as a prophylactic to prevent infection. Detailed data on these are in [Pandemic Blunder](#). They are alternatives to the experimental vaccines, and some doctors are prescribing these generics despite actions by NIH, FDA and CDC to block wide use of them.

The main thing to fear now are increasing vaccine mandates that so many people will comply with out of sheer survival needs. Vaccine related deaths will keep being ignored by government and big media in order to safeguard the revenues of big drug companies making the vaccines.
