

Vaccine shedding spreads disaster to unvaccinated pregnant women?

By [Jon Rappoport](#)

Since the COVID vaccines were authorized, MANY women have posted reports of disrupted and unusual menstrual cycles, heavy bleeding, and miscarriages.

What's more, some of these women state they haven't received the COVID vaccine, but they've been in close contact with others who have been vaccinated—leading to the question:

Can the COVID RNA vaccine (which is actually an experimental genetic treatment) “shed” something harmful that can be passed from person to person?

Perhaps that sounds impossible, but...

What does Pfizer say about the dangers to pregnant women?

Let's consider a key Pfizer document, describing procedures to be followed in its clinical trial of the COVID vaccine. [The document](#) is titled:

“A PHASE 1/2/3, PLACEBO-CONTROLLED, RANDOMIZED, OBSERVER-BLIND, DOSE-FINDING STUDY TO EVALUATE THE SAFETY, TOLERABILITY, IMMUNOGENICITY, AND EFFICACY OF SARS-COV-2RNA VACCINE CANDIDATES AGAINST COVID-19 IN HEALTHY INDIVIDUALS.”

On page 67, we find a warning about potential adverse effects of the vaccine. The abstruse term “study intervention” pops up. It surely means “vaccination.” “Environmental exposure” means contact with elements of the vaccine other than by injection.

Warning of adverse effect:

“A female is found to be pregnant while being exposed or having been exposed to study intervention due to environmental exposure. Below are examples of environmental exposure during pregnancy:”

“A female family member or healthcare provider reports that she is pregnant after having been exposed to the study intervention by inhalation or skin contact.”

“A male family member or healthcare provider who has been exposed to the study intervention by inhalation or skin contact then exposes his female partner prior to or around the time of conception.”

These warnings, from the vaccine manufacturer, Pfizer, are shocking. They imply that pregnant women can be harmed by breathing in, or contacting by skin, the vaccine as it moves from person to person. Which would be “shedding.”

And what is being transferred from person to person? What is in the vaccine? Genetic material. RNA. RNA encapsulated in toxic lipid nanoparticles.

The Pfizer document states that, if any of these “adverse events” involving pregnant women occur during the clinical trial of the vaccine, they must be reported.

Chilling.
