[Global Research Wants to Hear From You!](#)

[Apr. 30, 2024](#) – *Breast cancer screening age officially lowered from 50 to 40, amid worrying rise of disease in young women*

The age that women should begin regular breast [cancer](#) screening has dropped from 50 to 40, according to new official guidance from the US' chief disease prevention body.

The US Preventive Services Task force (USPSTF) finalized Tuesday the draft recommendation from last year, amid rising cases of the disease in women under 50.

Recommendations from the group are almost always adopted as best practice by physicians across the US.

For instance, the same agency lowered the [minimum colonoscopy screening](#) age from 50 to 45 last year.

The ruling reverses longstanding guidance recommending women start regular screening, done through a specialist x-ray called a mammogram, at age 50.

Dr John Wong, USPSTF vice president, cited a rise in breast cancer cases in women under 50, which [recent research shows](#) has increased by three percent per year.

This includes [actress Olivia Munn](#), who was diagnosed with the disease at age 43 after an initial test missed her tumor.

'There is clear evidence that starting screening every other year at age 40

provides sufficient benefit that we should recommend it for all women in this country to help them live longer and have a better quality of life,' Dr Wong, a primary care physician at Tufts Medical Center in Massachusetts, said.

USPSTF has [previously said](#) an extra 20 million women in their 40s would benefit from a mammogram every two years.

In a study published last year in [JAMA Network Open](#), researchers found that the number of women getting screened for breast cancer has declined since the Covid pandemic began.

Looking through 1.6 million breast cancer screening records, they found that screenings dropped by 14 percent in the first year of the pandemic.

Citing rising breast cancer rates in young women, an expert panel on Tuesday recommended starting regular mammography screening at age 40, reversing longstanding and controversial guidance that most women wait until 50.

The panel, the U.S. Preventive Services Task Force, finalized [a draft recommendation made public last year](#). The group issues influential advice on preventive health, and its recommendations usually are widely adopted in the United States.

In 2009, the task force raised the age for starting routine mammograms to 50 from 40, sparking wide controversy. At the time, researchers were concerned that earlier screening would do more harm than good, leading to unnecessary treatment in younger women, including alarming findings that lead to anxiety-producing procedures that are invasive but ultimately unnecessary.

But now breast cancer rates among women in their 40s are on the rise, increasing by 2 percent a year between 2015 and 2019, said Dr. John Wong, vice chair of the task force. The panel continues to recommend screening every two years for women at average risk of breast cancer, though many patients and providers prefer annual screening.

“There is clear evidence that starting screening every other year at age 40 provides sufficient benefit that we should recommend it for all women in this country to help them live longer and have a better quality of life,” said Dr. Wong, a primary care clinician at Tufts Medical Center who is the director of comparative effectiveness research for the Tufts Clinical Translational Science Institute.

April 26, 2024 - CANADA (CTV News)

[Apr. 26, 2024](#) - 'Too young to have breast cancer': Rates among young Canadian women rising

Breast cancer rates are rising in Canada among women in their 20s, 30s and 40s, according to a research by the University of Ottawa (uOttawa).

The study reviewed breast cancer cases over 35 years to shed light on trends in breast cancer detection in Canada, said the university in a news release on Friday.

It finds that the risk increases with age:

- Women in their 20s: There were 3.9 cases per 100,000 people between 1984 and 1988, compared to 5.7 cases per 100,000 between 2015 and 2019 for a 45.5 per cent increase.
- Women in their 30s: There were 37.7 cases per 100,000 people between 1984 and 1988, compared to 42.4 cases per 100,000 between 2015 and 2019 for a 12.5 per cent increase.
- Women in their 40s: There were 127.8 cases per 100,000 people between 1984 and 1988, compared to 139.4 cases per 100,000 between 2015 and 2019 for a 9.1 per cent increase.

The study is led by Dr. Jean Seely – Head of Breast Imaging at The Ottawa Hospital and professor in the Department of Radiology at uOttawa. Dr. Seely says the rising rates among younger women is alarming, noting that women in their 20s and 30s are not regularly screened for breast cancer.

“Breast cancer in younger women tends to be diagnosed at later stages and is often more aggressive,” said Dr. Seely.

Dr. Seely suggests targeting younger women in breast cancer awareness campaigns and screening programs.

“We’re calling for increased awareness among health-care professionals and the public regarding the rising incidence of breast cancer in younger women,” said Dr. Seely.

“We need to adapt our strategies and policies to reflect these changing trends, ensuring that all women, regardless of age, have access to the information and resources they need to detect and combat this disease.”

The study also says more research is needed to understand the root cause of rising breast cancer rates among younger women.

Chelsea Bland was diagnosed with breast cancer when she was 28.

Though Bland is two years cancer free, she remains on hormone therapy today. Her experience prompted her to establish a local group to offer support for women between the

ages of 28 and 40.

"I hope that by bringing awareness to this study it makes people think twice about saying that being in your 20s, 30s and 40s is too young to have breast cancer. In my support group, I have heard the same story over and over again," Bland said.

"Young women are not being taken seriously after they find a lump because they are told they are too young for breast cancer. This has ultimately led to delays in being diagnosed and being diagnosed at a more advanced stage. We are not too young for this and this is happening to women who do not have any high-risk genetic markers for breast cancer, myself included."

The study is published in the Canadian Association of Radiologists Journal.

Recent turbo breast cancer cases in women under age 40 I've reported (16 cases):

2024 Jan - Philippines - 27 year old Janah Solleza has been diagnosed with cancer. She made a video about getting COVID-19 vaccinated.

2024 Apr - NC - Two friends in 30s diagnosed with terminal cancer Sarah Glad was diagnosed with terminal breast cancer & 3 weeks later her best friend 35 year old Rebekah Dunston was diagnosed with Stage 3 Colon Cancer.

EXCLUSIVE I graduated from North Carolina 'cancer college' - at age 35 I've lost my best friend to the disease and am now battling stage three colon cancer myself

• DID YOU ATTEND CLASSES IN POE HALL AND GET DIAGNOSED WITH CANCER? WRITE TO US AT HEALTH@DAILYMAIL.COM

Just three weeks after her best friend was diagnosed with terminal breast cancer, Rebekah Dunston discovered she herself had stage three colon cancer.

The pair were in their early thirties and in the prime of their lives — Sarah Glad was 14 weeks pregnant and Mrs Dunston had just got married.

They had met while studying communications at North Carolina State University, with a bulk of their studies taking place in a now-notorious campus building.

The Poe Hall building has since been closed after 160 staff, students and alumni reported developing cancers and other diseases at unusually young ages to WRAL. An investigation of the building by Geosyntec Consultants also found its hallways, lecture halls and classrooms contained dangerous levels of toxic chemicals.

'I definitely noticed at the time that the building was old and gross,' Mrs Dunston, now 35, told DailyMail.com. 'Then a year after leaving the university, I was diagnosed with stage three colon cancer. It was obviously very shocking, because I was only

Mrs Dunston said she felt failed by the university. 'Nothing's going to give me back my health for the past couple of years, and nothing's going to bring Sarah back.'

Mrs Glad died earlier this year, roughly two years after her diagnosis of breast cancer.

'Sarah and I would send each other text messages and letters in the mail while we were both going through treatment, just sending words of encouragement and keeping each other as positive as possible. Losing her in January... it's been really, really difficult,' Mrs Dunston said.

Investigations have found dangerously high levels of a poisonous, potentially cancer-causing substance called polychlorinated biphenyls (PCBs) detected in Poe Hall.

Studies show that PCBs may suppress the immune system, allowing cancers to develop and spread.

In five areas, PCB levels were found to be more than 38 times the Environmental Protection Agency's safety limit.

TRAGEDY: Rebekah (left, in hospital) discovered she had stage three colon cancer just weeks after Sarah found out she had terminal breast cancer. The pair were in their early thirties and in the prime of their lives — Sarah was 14 weeks pregnant (with her baby boy) and Mrs Dunston had just got married

HAPPIER TIMES: Mrs Dunston (middle) with Mrs Glad (right) and their friend. 'Nothing's going to bring Sarah back,' Mrs Dunston told DailyMail.com

The Worldwide Corona Crisis, Global Coup d'Etat Against Humanity

by Michel Chossudovsky

Michel Chossudovsky reviews in detail how this insidious project “destroys people’s lives”. He provides a comprehensive analysis of everything you need to know about the “pandemic” — from the medical dimensions to the economic and social repercussions, political underpinnings, and mental and psychological impacts.

“My objective as an author is to inform people worldwide and refute the official narrative which has been used as a justification to destabilize the economic and social fabric of entire countries, followed by the imposition of the “deadly” COVID-19 “vaccine”. This crisis affects humanity in its entirety: almost 8 billion people. We stand in solidarity with our fellow human beings and our children worldwide. Truth is a powerful instrument.”

Reviews

This is an in-depth resource of great interest if it is the wider perspective you are motivated to understand a little better, the author is very knowledgeable about geopolitics and this comes out in the way Covid is contextualized. —Dr. Mike Yeadon

In this war against humanity in which we find ourselves, in this singular, irregular and massive assault against liberty and the goodness of people, Chossudovsky’s book is a rock upon which to sustain our fight. —Dr. Emanuel Garcia

In fifteen concise science-based chapters, Michel traces the false covid pandemic, explaining how a PCR test, producing up to 97% proven false positives, combined with a relentless 24/7 fear campaign, was able to create a worldwide panic-laden “plandemic”; that never have been possible without the infamous DNA-modifying reaction test - which to this day is being pushed on a majority of innocent people who have no clue. His conclusions are evidenced by renown scientists.

Professor Chossudovsky exposes the truth that “there is no causal relationship between the virus and economic variables.” In other words, it was not COVID-19 but, rather, the deliberate implementation of the illogical, scientifically baseless lockdowns that caused the shutdown of the global economy. —David Skripac

A reading of Chossudovsky’s book provides a comprehensive lesson in how there is a global coup d’état under way called “The Great Reset” that if not resisted and defeated by freedom

loving people everywhere will result in a dystopian future not yet imagined. Pass on this free gift from Professor Chossudovsky before it's too late. You will not find so much valuable information and analysis in one place. -Edward Curtin
